# SEVONE DATA INSIGHT: EASILY FIND, USE AND SHARE NETWORK PERFORMANCE INSIGHTS.

To advance their digital transformations, enterprises, CSPs and MSPs are moving from static to dynamic networks. In these new, software-driven environments, things move quickly and change rapidly—too fast, in fact, for traditional network management systems.

The mismatch between modern networks and legacy monitoring creates blind spots with enormously negative consequences.

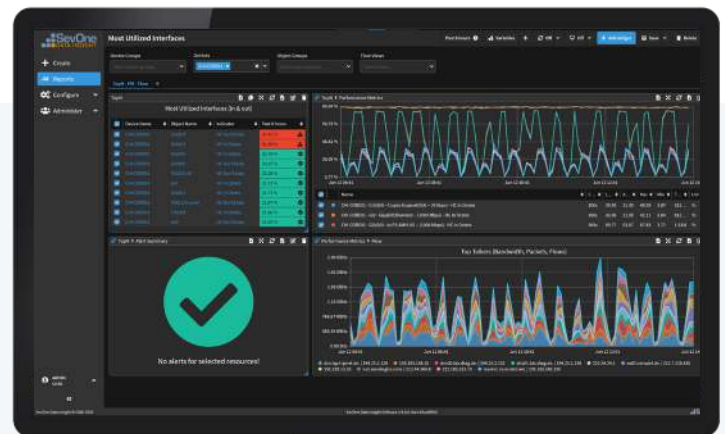

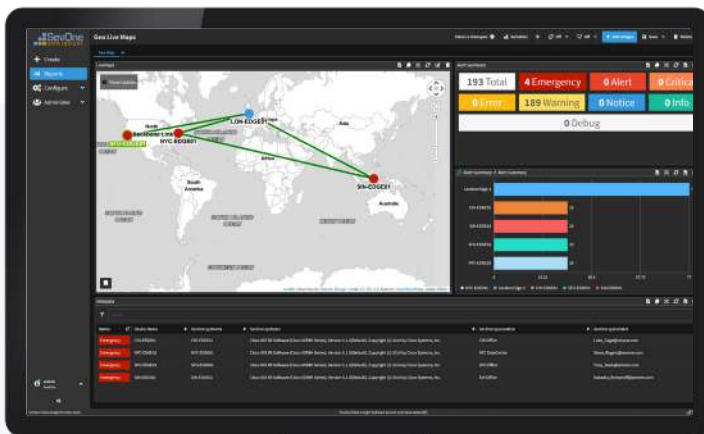

To close that gap, what enterprises, CSPs and MSPs need are network monitoring capabilities that are just as fast, flexible and scalable as their new networks. More specifically, they require faster, smarter and easier ways to gather and analyze performance data, shape the resulting operational insights, and share them with all types of users across their organizations.

SevOne Data Insight meets this need. As an integrated component of our industry-leading SevOne Network Data Platform, Data Insight leverages real-time monitoring coupled with day one reporting, making it easy for users to find, use and share valuable network performance insights.

### Simple and Reusable Reporting and Troubleshooting Workflows

To achieve their goals and minimize service delivery risks, operations, engineering and line of business teams all need fast and accurate insights drawn from a broad set of network resources. Data Insight delivers:

- Simple, reusable and scalable reporting
- Simple and reusable troubleshooting workflows
- Simple unification of SevOne and third-party data

## VISUALIZE.

Simple, reusable and scalable reporting enables operational consistency across teams.

## COLLABORATE.

Simple and reusable troubleshooting workflows enable teams to easily move from “awareness to analysis.”

## UNIFY.

Simple unification of SevOne and third-party data in the same dashboard.

## FEATURES & BENEFITS

- **Simple, Reusable & Scalable Reporting**

Experience immediate, out of the box value, with a series of auto-populating day one reporting of metric and flow data for common network performance reporting needs including: Alert dashboards, TopN views, summary reports coupled with device, object and indicator templates, and more.

Easily edit any of the day one reports or create new reports from scratch—in both dark and light mode—then reuse them for different regions/offices, saving hours of report building.

Reuse and share any report to enable consistent insights across multi-site operations teams.

Reports data in seconds—easily scales to support the largest SevOne NMS Clusters, with thousands of users.

- **Simple Unification of SevOne & 3rd Party Data**

Integrate with Jupyter notebooks to visualize 3rd party data sources alongside SevOne data in the same dashboard.

- **Flexible Deployment**

A cloud-native architecture provides deployment options in private and public clouds, as well as physical servers.

- **Simple & Reusable Troubleshooting Workflows**

Quickly pivot and easily visualize related metric, flow and alert data through enhanced chaining, coupled with new interactivity between chained widgets in the same report—and then share these reports across their teams.

Increase operational consistency with the simplified creation of troubleshooting workflows by linking multiple reports together—and then sharing these workflows across their teams.

Easily move from “awareness to analysis.”

- **LiveMaps**

Easily create device- and link-based status dashboards with geospatial maps and customized images (e.g. floor maps, server rooms, etc.), automated map clustering and bookmarks for quick access to key visualizations.

- **MSP Ready**

Support multi-tenant service provisioning operations with customized UI branding and look & feel for each tenant. Easily load in new users and manage user administration for each tenant without any direct user interaction.

## CUSTOMIZE YOUR INSIGHTS

SevOne Data Insight ships with reusable visualization widgets that are embedded with deep knowledge of SevOne data structures. These templates can be easily configured for inclusion in a report or linked as part of a customized workflow. These visualization widgets include:
